

Introduction to the Master Page & Content Area

You can place objects on the Master Page that you want to appear on every page, for example a header, footer or buttons.

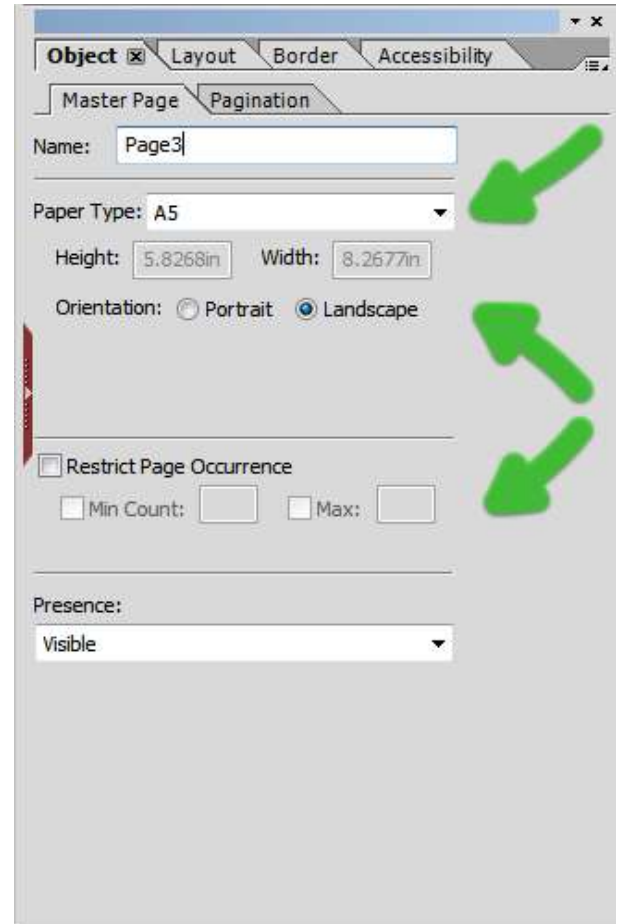

Every form will have at least one Master Page, but you can add more if you need to change the layout or content in the form. For example this form has three Master Pages.

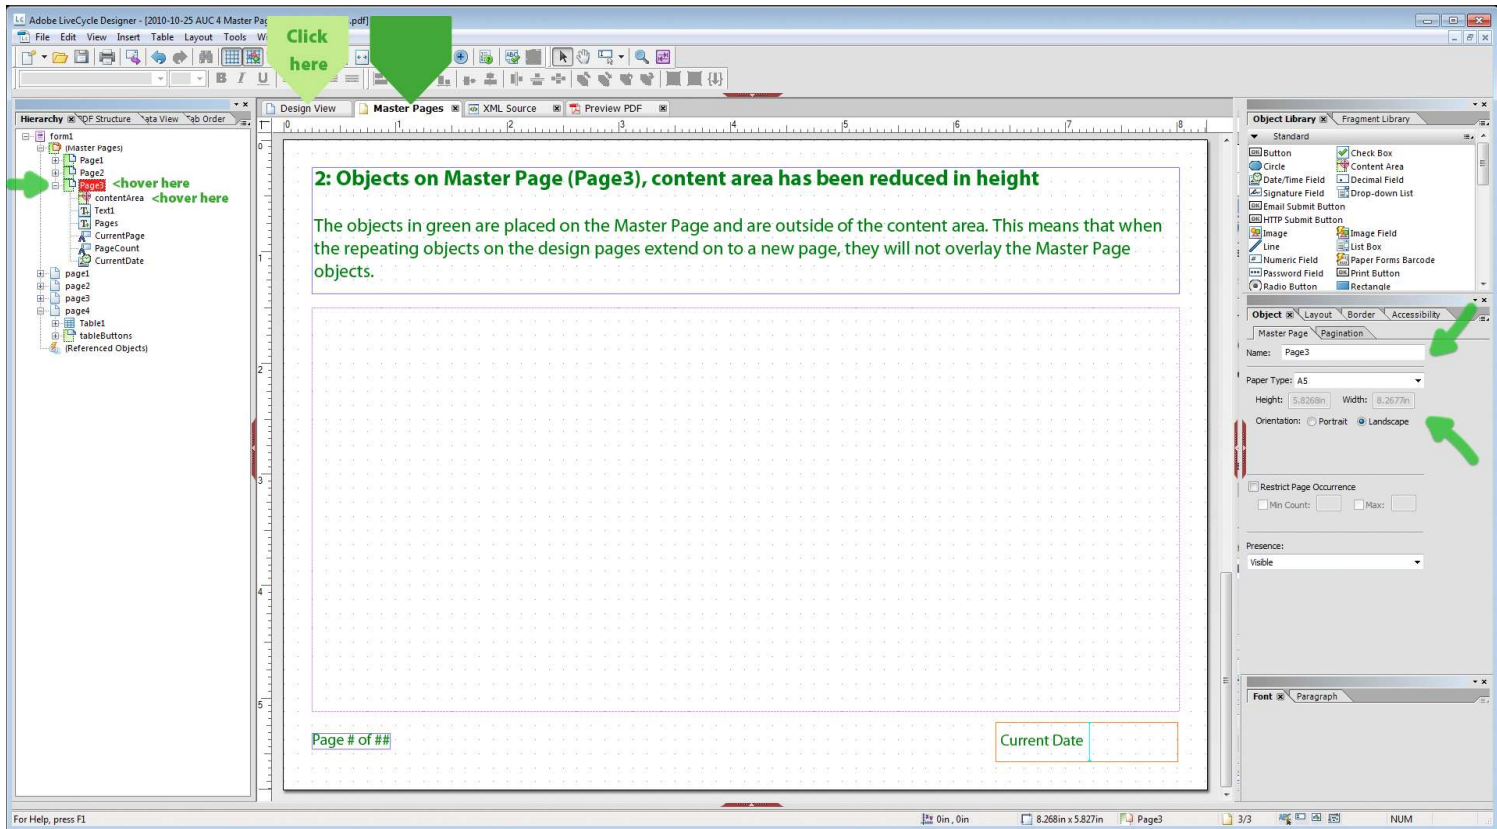

Each Master Page has a content area that defines the area on the design page that will accept objects. Where you have a flowed form it is a good idea to re-size the content area so that objects on the Master Page are outside of the content area. See the workspace on the last two pages.

When you select the Master Page in the hierarchy you can set its properties in the Object > Master Page and Object > Pagination palettes.

When you select a page in the design view, you can set which Master Page it uses in the Object > Pagination palette.

It is a good idea to name Master Pages with a capital 'P' and design pages with a lower case 'p'.

A typical workspace. Click the highlighted areas to change the view between Master Page and Design View.

1: Objects on Master Page (Page2), but content area has not been set correctly

The objects in red are placed on the master page, but within the content area. This means that when the repeating objects on the design pages extend on to a new page, they will overlay the master page objects.

Item	Description	Quantity	Unit Price	Amount

Add row		Edit		Reset this table	

2: Objects on Master Page (Page3), content area has been reduced in height

The objects in green are placed on the Master Page and are outside of the content area. This means that when the repeating objects on the design pages extend on to a new page, they will not overlay the Master Page objects.

Item	Description	Quantity	Unit Price	Amount
